Up to **\$5000** towards a Heat Recovery Ventilator

What is a Heat Recovery Ventilator?

At the core of an HRV is the heat transfer module. Both the exhaust and outdoor air streams pass through the module, and the heat from the exhaust air is used to pre-heat the outdoor air stream. Only the heat is transferred; the two air streams remain physically separate. Typically, an HRV is able to recover 70 to 80 percent of the heat from the exhaust air and transfer it to the incoming air, but depending on the size of unit relative to the size of your home, can be up to a maximum of 95%. This dramatically reduces the energy needed to heat outdoor air to a comfortable temperature.

**Breath clean air, reduce your carbon footprint,
and save money!**

Already have a Heat Recovery Ventilator in your Standard Package?

Then use the \$5000 towards other Built Green items.

Spray Foam insulate your foundation walls or

Install Triple Pane Sol-R Shield windows or

Anything to help your home to be more Built Green!
